Subject: GLYPHOSATE NSRL
Date: Thursday, May 25, 2017 9:55:24 AM

Dear OEHHA,

There is no safe level of glyphosate!!

Glyphosate herbicide has been found in tap water, our children's urine, mother's breastmilk, and childhood vaccines.

Glyphosate has been shown by Monika Kruger of Germany to bioaccumulate in bone marrow, muscle tissues etc.

Glyphosate has been shown to be a neurotoxin, chelator, antibiotic, and carcinogen which also causes liver disease.

One way glyphosate functions is by breaking down the blood-brain barrier and allowing other toxins (such as those found in vaccines and herbicides) into the brain.

Please protect all Californians, but especially our children, by making sure that all glyphosate containing products are properly labeled as hazardous.

Thank you,

Valerie Noble
